Review

In this document, I will demonstrate and show how I will gather feedback from both a technical audience and a non technical audience, how I'll record and receive this feedback, and what I'll do with it.

Audience

My audience for this feedback will consist of both technical, and non technical users. Technical users are those that have experience / a background in programming, essentially being able to understand the back end / more in depth, expert questions, whilst non technical users are those that use the website for a general purpose. This tends to be the clientele of the website, or just your everyday audience.

For my technical audience, I will be using students undertaking the same exam as me. This is because they have knowledge of the backend requirements and client's requirements, allowing them to give me extensive feedback based on what the client actually needs, and whether or not they can spot potential problems or improvements to the backend that I might've missed.

For my non technical audience, I'll be using people from the same college to gather their opinions from the point of someone who doesn't understand what the project is for. This is because I'll be able to deduce if my website is clear and concise, allowing all different types of users to understand the purpose of it, as well as being able to gather useful feedback such as what they think could improve it.

Data Gathering Plan

In order to gather my feedback, I plan on using "Google Forms". This is because it is easy to create a wide variety of questions, automatically storing responses in a structured format, is easily accessible for both technical and non-technical users and it can be exported into spreadsheets for analysis.

In order for the users to be able to view the website and test it to give me the feedback that I'll need, I will be hosting my website through XAMPP on the eduroam wifi. I will ask users to connect to eduroam, and go to the following website link; "10.138.37.74". This will allow the users to freely explore my website, with fully working backend and front end.

This way I can ensure that data is gathered in a semi controlled environment, where my feedback won't be prone to botching, however, some individuals may create troll responses. Because of this, I'll need to go through all the responses carefully, and check to ensure that they are valid as google forms don't have much validation / It can be tricky to validate qualitative data.

Additionally, in the context of the questions on the feedback form, I will provide images of the website / relevant content in the question so that users know what page I am referencing.

For this, I plan to gather between 20 to 30 responses.

Types of questions

For technical users, I will ask them questions such as; “Does the website meet the client’s functional requirements?”, “Are there any issues with validation, security or data handling?”, “Is the navigation logical from a technical standpoint?”, “Are there any backend improvements you would suggest?”. These questions will have additional questions that follow such as “If you have found an issue, what was it?” for more in-depth answers.

For non technical users, I will be asking questions such as; “Is the purpose of the website clear?”, “How easy is it to navigate the site?”, “Do the colours, layout, and design feel appropriate?” etc.

Additionally, I’ll need to measure important metrics such as loading speeds of the website, or

What I’ll do with the feedback

Since I’ll be using google forms, I’ll have automatically generated charts with response counts and average ratings. I can use these to create an informed document regarding future plans about how I can further improve my website, going through each question and gathering what the users have thought. These questions should be categorised by categories such as Design, Usability, Functionality and Performance.

Understanding the feedback

After gathering 9 responses, 5 being technical and 4 being non-technical, I got a decent variety of answers. I will now be going through the feedback I've received and try to see what I could improve upon.

During the analysing phase, some more responses were filled in so the later questions may have more than 9 responses.

https://docs.google.com/forms/d/e/1FAIpQLSdwKToJ8RBP8gENeSqsvRpiA5PZZAnvILrjhsLta7KKD1ID4w/viewform?usp=dialog

1.

How quickily did the website load for you?

Copy chart

9 responses

The most common answer was under half a second. This question refers to my KPI's of loading speeds, however, this is a poor way of measuring the loading speeds as users cannot really tell the difference between 1 second and half a second.

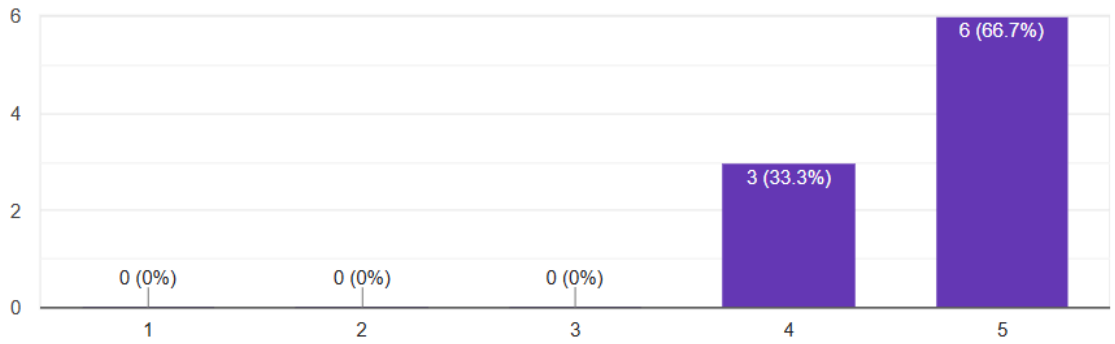
This process should be automated to be improved further.

2.

How did you find the navigation of the website?

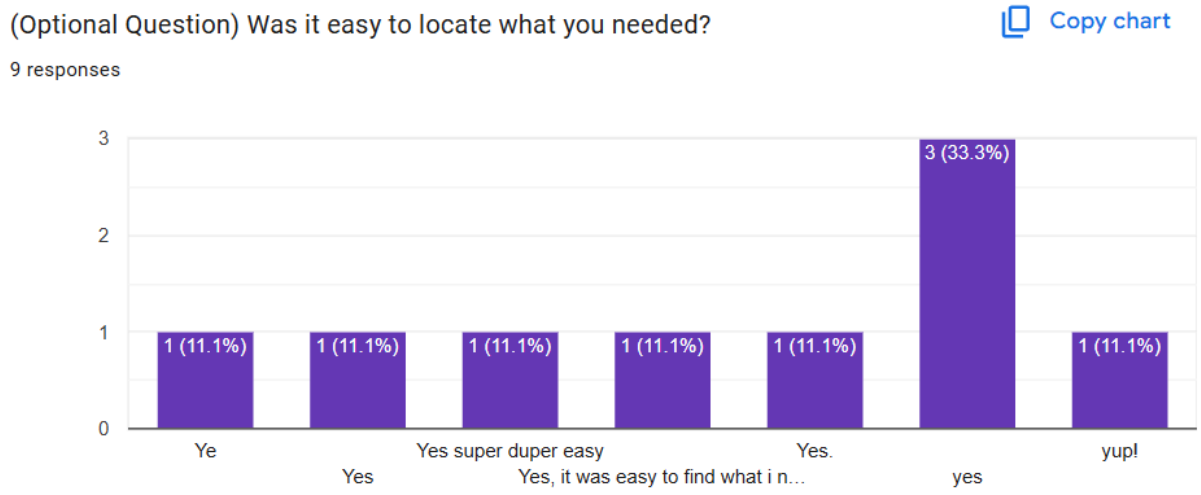
Copy chart

9 responses



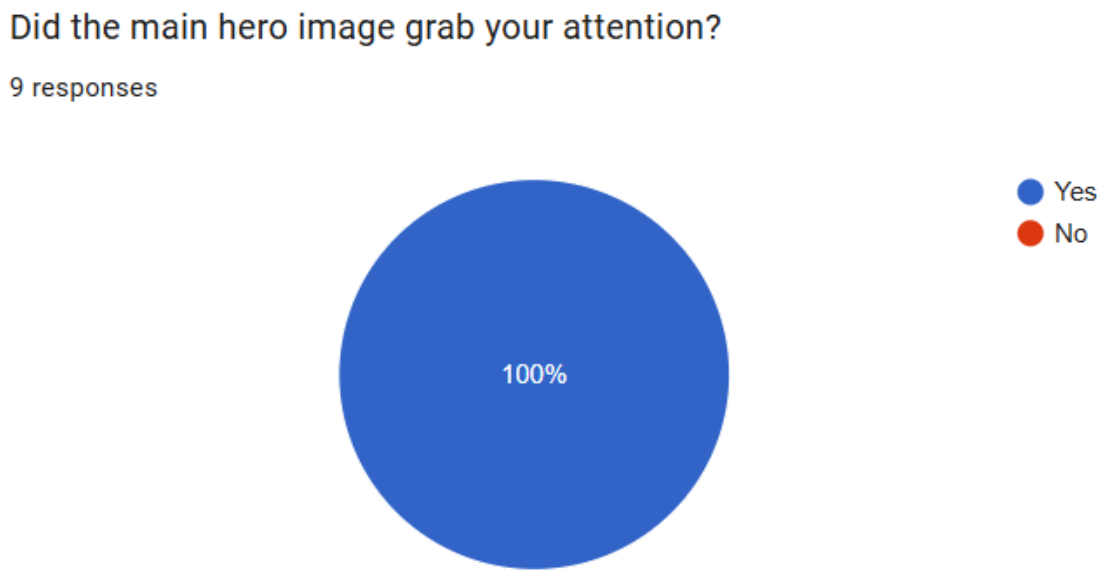
My navigation bar received an average score of 4.7, which is above excellent, showing that the website is easy to navigate and straightforward.

3.



This builds upon question 2, further proving that it was easy to navigate across the website and find what the user needs

4.



The main hero image was a good idea, proven by these responses. This shows that the hero image grabs the users attention extremely well, improving the KPIs as users are less likely to click off.

5.

What did you think of the overall layout of the website? Any positives and negatives should be written here.

9 responses

- good
- Positives: Amazing layout, it was the most intriguing and eye catching layout from such a a promising and upcoming new developer, fenemonal
- It's a nice modern design, I can't really think of any negatives.
- I think the overall layout of the website is good however there are some things that can be changed.

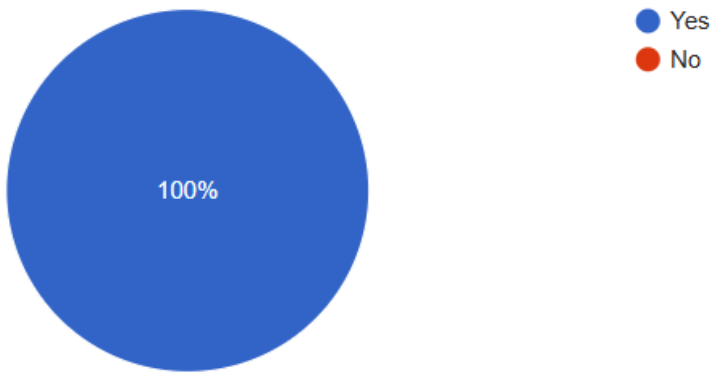
  For example on the homepage, the links to the products are still underlined in blue which doesnt fit the rest of the website and makes it look not good
- Very easy to navigate and find what I need
- simple to use as everything is on the same page!
- intuitive and easy to navigate to what i need

The layout seems to get consistent positive feedback, with some feedback being that the links for products being underlined are not good, however, other than that, all the layout received positive feedback.

6.

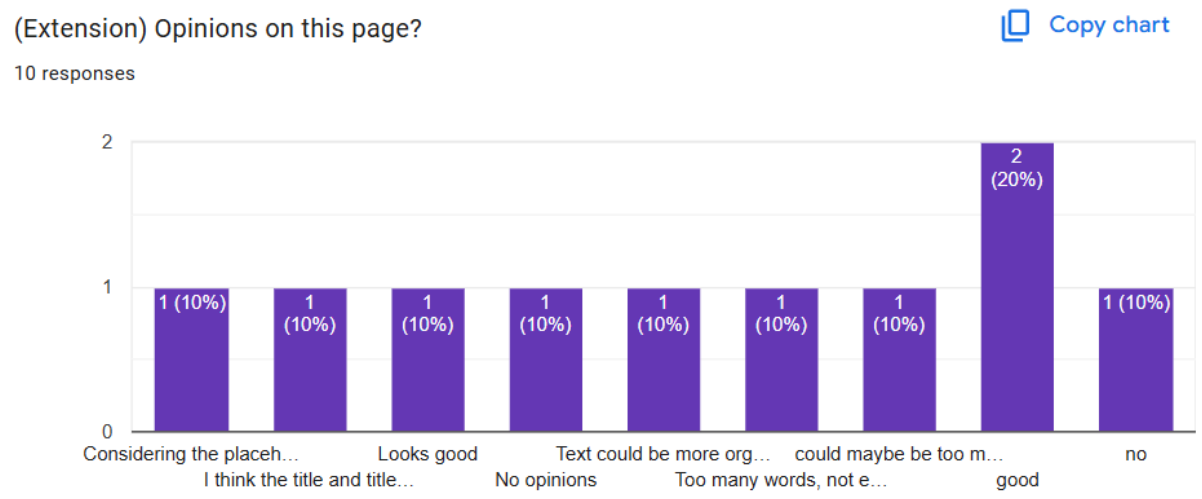
Is the products page easy to understand (Placeholder text will be replaced with actual information in the final solution)

10 responses



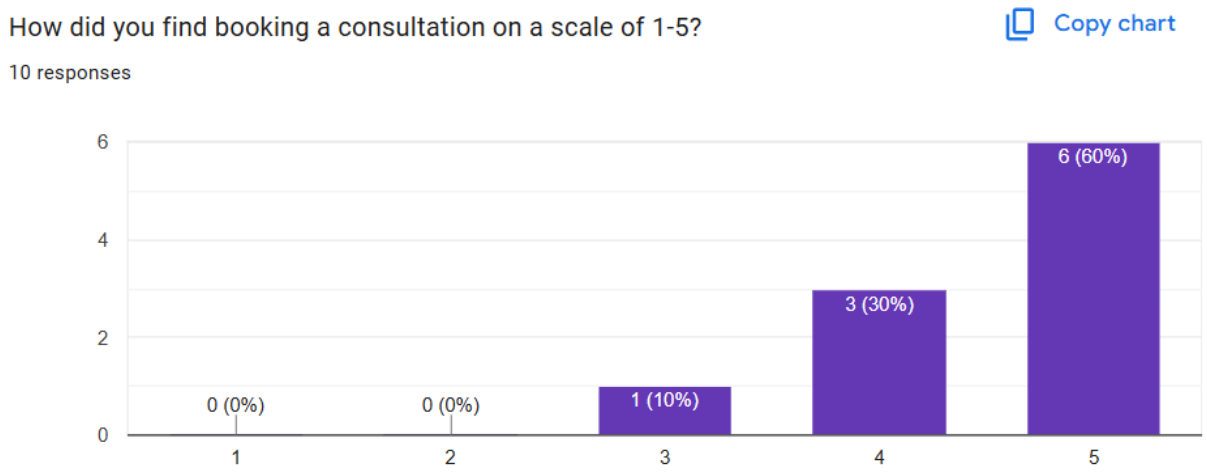
All users found that the products page is easy to understand, taking into consideration that the text is placeholder for now.

7.



The only negative feedback for the products page was that there was too much text, which was stated that would be a placeholder for now. This means that the layout is good, just content needs to be updated.

8.



The booking received an average score of 4.5, showing that it was easy to use and understand.

9.

Is there anything you want to mention about the consultations?

7 responses

- Nah
- Name and email could have been taken from the logged-in account and i can't see my booking in the account section.
- no
- idk
- nah
- nope!
- good

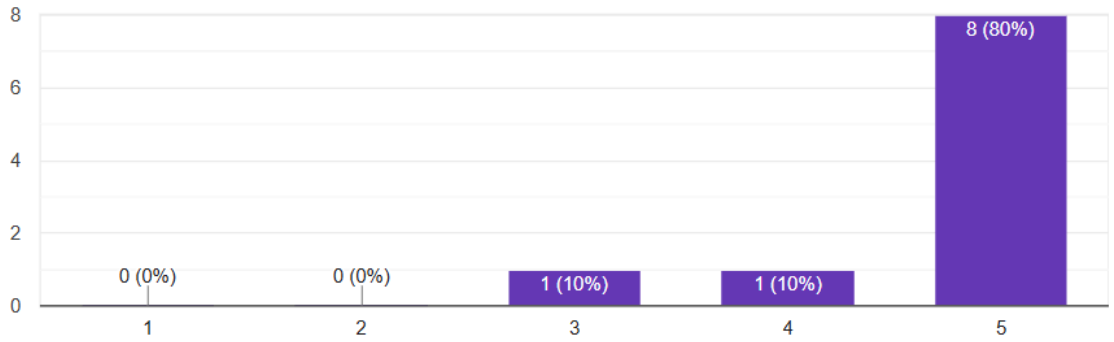
One response was due to user error, as the user needs to create a booking first with the correct email to see their booking, other than that, the consultation section was relatively well received.

10.

How did you find using the EV Charger locator service?

Copy chart

10 responses

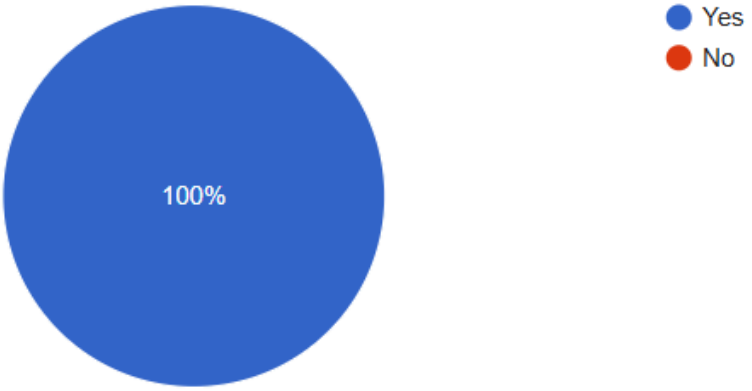


The EV Charger locator service received a rating of 4.7. This shows that the service is well received and useful.

11.

Do you think this is a useful addition?

10 responses



This is further referenced by question 11, which all users found the service to be useful.

12.

Did you find the footer useful / of any help. Does it contain all you need?

10 responses

- Yeah in case I need everything
- Contains everything necessary and all of the legal policies are easily accessible, however these pages could be made easier to read as they are quite bare with no styles.
- yes
- Yes it's useful
- Yes, i think it is very good and useful
- It contains everything you need
- useful
- everything i need is present
- Yes

The only negative piece of feedback was that the policies pages were not styled / could be formatted better. This is because the pages were placeholders, but for the final solution, the pages will be updated to match the style of the website. Good feedback.

13.

How did you find the signup process?

10 responses

intutii ve

Sign-up process was simple and well validated.

easy

It's easy to use and there is password validation which is nice.

I found the signup very good

easy to use and understand

simple

It was easy to understand

Easy

Users found the signup process easy to use and understand.

14.

How did you find the log in process?

10 responses

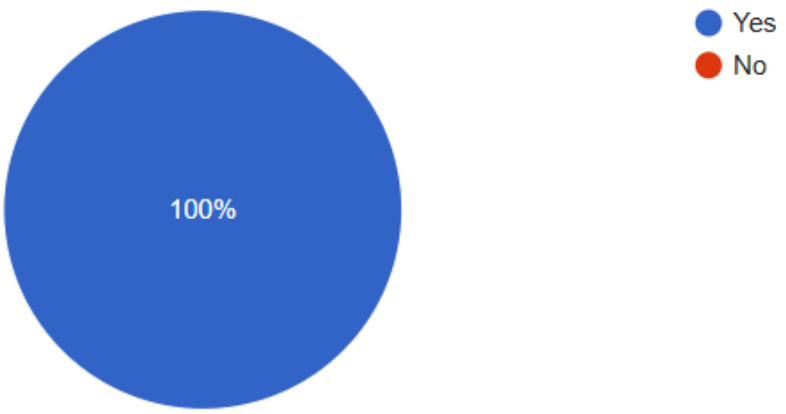
- I found it on the top right
- Log-in could be made to highlight which section is wrong as the messages are almost the same.
- easy
- I have used the same email address and password when I signed up however could not log in.
- Very good
- easy to use and understand
- simple
- same as last question
- Easy

The users also found the log in process to be straight forward. Some things to take into account are that the error messages could be made different from each other. Another thing to take into consideration is that potential user error could have been in effect as out of 10 responses, only one failed to log in.

15.

Was all the information you needed present in the "Your Account" page?

10 responses



This shows that the information provided under the Your Accounts page was sufficient and had everything that the users may have needed.

16.

Is there anything you want to mention regarding the last 3 questions?

9 responses

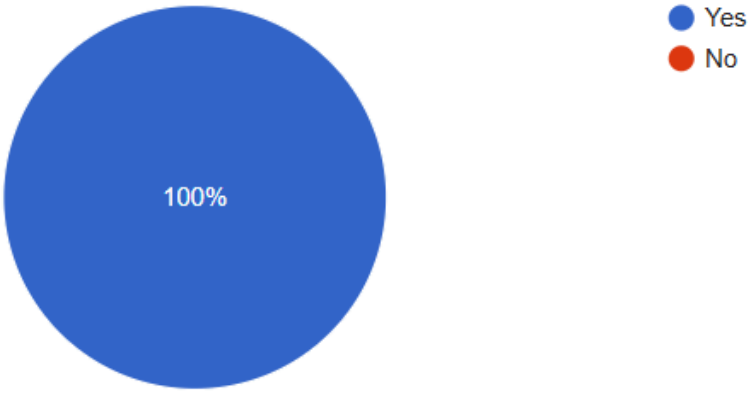
- no
- The EV Charger was missing navigation
- After booking a consultation i could not see it in the history of the account.
- I couldn't log in
- Na mate
- There is a missing EV Charger tab in the navigation on the accounts page
- No
- good

A common piece of feedback here was that the EV Charger tab was missing in the navigation on the accounts page or products page. This is an error that I missed whilst developing as I forgot to place it on the new pages.

17.

Are the accessibility features useful?

10 responses



All users found the accessibility features useful.

18.

Do you want to mention anything regarding the accessiblility settings?

6 responses

no
Nah its good
could use some work, especially with text to speech from my browser which is difficult to use due to the fact that you cannot select any text
good

Using this feedback, user select needs to be enabled so that text to speech mechanisms can work.

19.

Did you come across any errors when testing the entire website? If so, what were they?

9 responses

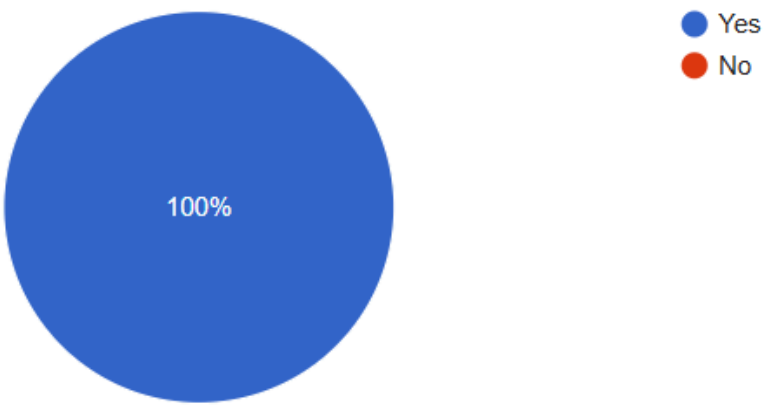
- no
- Navigation
- booking does not show in history
- none
- I have not found any errors
- When you enter your phone number and press save it doesnt load it
- There is a missing EV Charger tab in the navigation on the accounts page
- On the privacy policy and terms and condition pages you cannot return to the main site after clicking on them

This shows me that there are minor errors with the navigation not showing the EV Charger tab, and the policy pages not being able to return to the main page (as they have no styling). Additionally, there is a minor error on the accounts page with phone number, when pressing save it wont load. This can be easily fixed.

20.

Would you use this website if you had the need for it?

10 responses



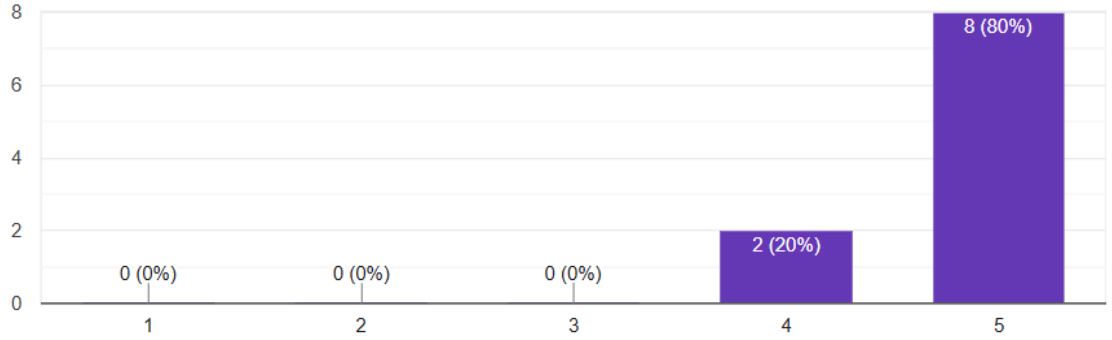
This shows that all the users would be willing to use this website if they had the need for it, which is good as it means that it would have a high retention rate.

21.

What do you think of the overall layout / readability of the solution?

Copy chart

10 responses



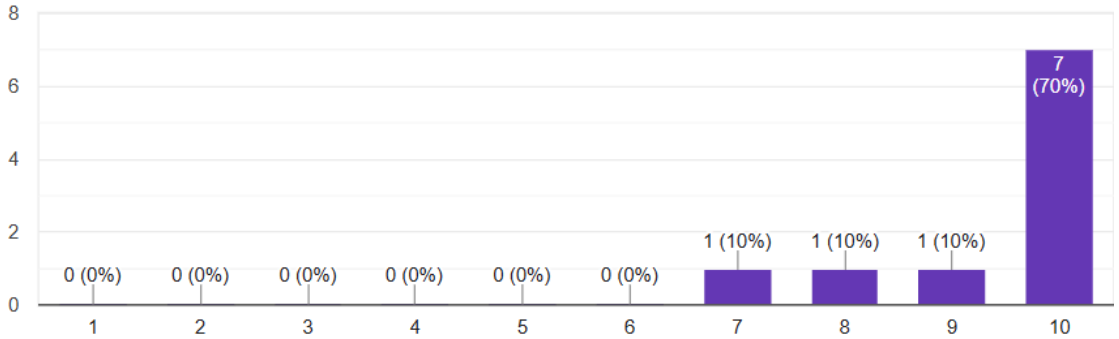
Overall, the layout received a total of a 4.8 rating,

22.

How satisfied are you with the solution? (scale between 1 to 10)

Copy chart

10 responses

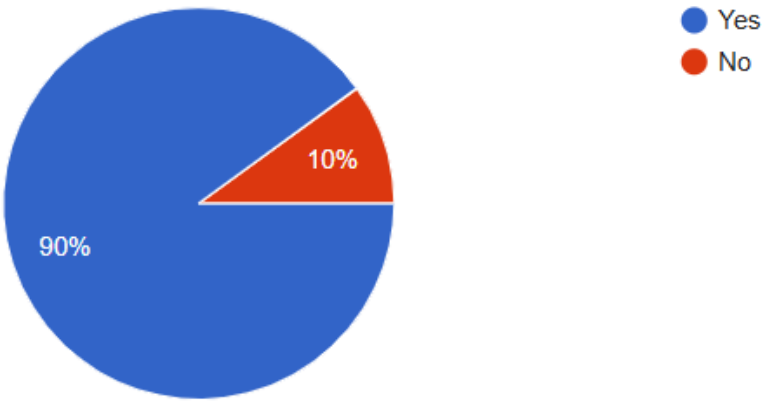


Overall, users were satisfied with a 9.3/10 rating, which is over the 80% minimum standard satisfaction rate across other web pages. This shows that the website is good for users and they are happy with their experience.

22.

Were you enticed to create a booking or consultation?

10 responses

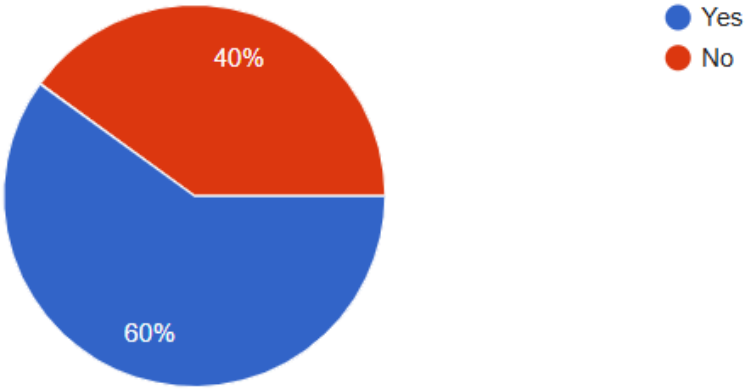


This shows that most users were enticed with creating a booking or consultation, this is good as it's one of the main features of the website, increasing conversion rates.

23.

Have you tried the website on a different device (other than laptop / typical desktop device)

10 responses



6 of the users tried the website on a different device. This is important for future questions.

24.

If yes to the last queston, How was the scaling on that device? Was all content still easily accessible / readable?

6 responses

good

website generally scaled quite well however the main home page with the hero image was not visible fully even when clicked on the home button on the header, this could be made better by replacing the image for a better resolution for mobile devices.

It was readable for the most part however the header was messed up at around 550px (width)

Scaled perfectly

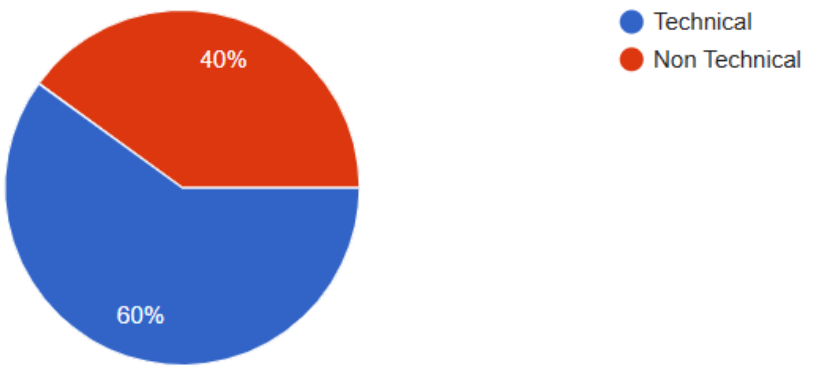
yes

Based on question 23, most users found the scaling of the website good on different devices, however the hero image wasn't scaling properly.

25.

Are you a technical or non-technical user?

10 responses



6 of the users were technical users.

26.
Moving onto technical user feedback,

Look at the formatting of the codespace. What do you think of it?

6 responses

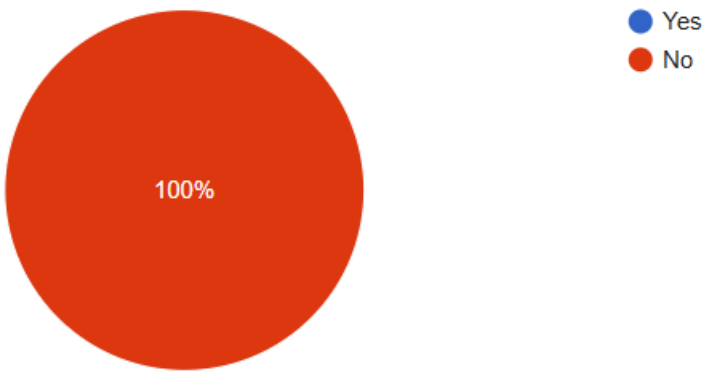
- good
- formatting of the file structure is easy to understand and will allow future developers to easily continue the project.
- Nice layout
- Very good, however put the sql file seperately
- Everything is consistant, although the CSS names could be lowercase
- Its good

Organisation was said to be satisfactory by technical users.

27.

When testing consultations / Account features, did you come across any issues?

6 responses



No errors were found in the main aspects of the website.

28.

If yes, what were the issues?

0 responses

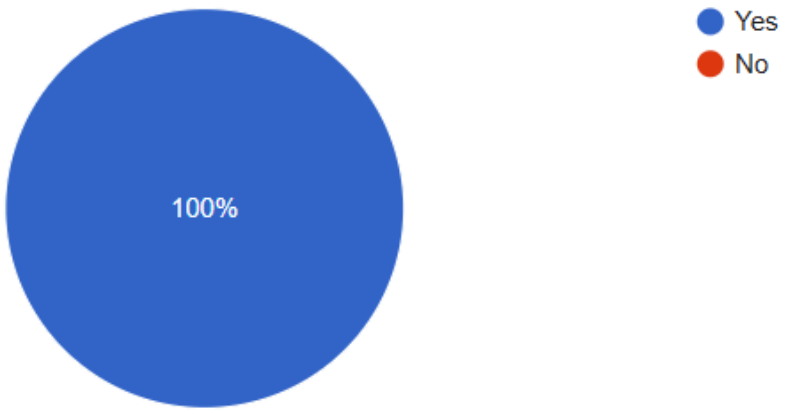
No responses yet for this question.

Further proven by this question as no issues were described.

29.

Do you think that the code is maintainable / readable?

6 responses



This question shows that the code was maintainable and readable.

30.

Is there anything you'd like to suggest?

1 response

keep line length of code up to 79 characters to comply with conventions and make the code easier to read.

This is a good piece of feedback, as it will be easier to maintain code if lines are under 79 characters in length.
