Task 2: Test log

Description of test	Test data to be used (if required)	Expected outcome	Actual outcome	Comments and intended actions
Test all page navigation 15:00 15/01/26	Mouse clicks	All pages should be navigable, including policy pages. No errors should occur during navigation	Some pages aren't able to be accessed	The naming of the pages was incorrect.
Test all page navigation 15:02 15/01/26	Mouse clicks	All pages should be navigable, including policy pages. No errors should occur during navigation	All pages are navigatable	Fixed all incorrectly named pages / navigation variables.
Testing logging in feature 15:06 15/01/26	Using test@gmail.com and incorrect password	Should give an error message that says the password is incorrect	No error message is given. Additionally, in the console, consultations and installations are returned for the email without being logged in, giving access to personal / private information	Ensure that error messages are visible and that consultations are only returned on LOGGED IN accounts
Testing logging in feature 15:07 15/01/26	Using incorrect email and incorrect password	Should give an error message that says the password is incorrect so that users do not know if the email exists or not as it can be a security vulnerability	No error message is given. (not yet patched)	Patch the error message

Testing Logging in feature again 16:02 15/01/26	Try combinations of correct emails with correct passwords and incorrect ones too	For incorrect combinations, error message should be displayed, for correct combinations, the user is to be redirected	Error message occurs, proper redirection occurs	Patched both the error message and the consultations showing upon writing just the email.
Test creating an account 09:59 16/01/26	Try to create an account with an invalid email such as "gmail.com" with a valid password (meets all conditions)	It should give an error message or alert saying that the email is invalid	Gives an alert saying that the email is missing an "@" symbol.	Works as intended
Test creating an account 10:01 16/01/26	Try to create an account with the email "gmail@gmail.com" (valid email) with a password that doesn't meet the conditions	It should give an error message saying that the password does not meet the required conditions	Gives an alert saying that the conditions are not met (not 8 characters, no number, no special character)	Works as intended
Test creating an account 10:04 16/01/26	Try to create an account with the email "gmail@gmail.com" (valid email) with one password that meets the conditions and the other password not matching	Should give an error message saying that the passwords do not match each other	Gives an error message saying "passwords do not match"	Works as intended
Test creating an account 10:05 16/01/26	Try creating an account with extreme case passwords or emails (being really long)	Should still accept the password regardless or length, same with email	Accepts the passwords and emails with no issue	Works as intended

Ensure that passwords are securely encrypted 10:08 16/01/26 (Logging in was tested before signing up as a few features were being implemented and needed to be able to log in, made with demo account)	For created accounts, ensure that the passwords are encrypted using phpmyadmin	All passwords should be hashed and not be able to decypher	Passwords are securely hashed. email: test@gmail.com, password: $2y$10$a0OMO3ztPsKjFOf3t0nae3angTi.exmK5qB6leOUsm... email: admin@nokia.com, password: $2y$10$ktZWGiTfrYxZ1.nDzHlnWP3ocdmuO3aQeKYmXOa/Sr0w... email: test2@gmail.com, password: $2y$10$jhFQD9K.2EnjxSh6yRO.TnJQwEIEQ3XgAX2fCHQ/yf... email: jj345678909876543dfvbnjk6765sdcvbj784fvbnjuy6fgh..., password: $2y$10$Y7HcbO5BJXbnF.gdcbyVI7kusovkGJ6WzIhfdjCu4l8k...	Works as intended
Test creating a consultation for email "test3@gmail.com" 10:11 16/01/26	Fill out the consultation form. First and second names have no validation as names can vary, sometimes including special characters and maybe numbers, or being long in length. Test both positive and negative cases for remaining fields (emails being valid emails and invalid emails, phone numbers following /not following the standard UK phone number types, postcodes being UK valid postcodes, address can be anything and a reasoning.	If an email address is invalid, ie, missing an "@" symbol, it should alert the user. If a phone number is not a valid UK phone number, it should alert the user, if a postcode is not valid, it should alert the user, if fields are not filled in, it should alert the user. The test should say "successfully submitted" once the user meets all the requirements. Use email test3@gmail.com for this test.	All alerts show depending on what is missing going by order of what is missing (ie, if email and phone number is incorrect, first email will be shown as not correct, then once fixed, phone will show as incorrect), if all fields are filled in correctly, the form will be submitted and say "thank you for submitting your form"	Works as intended

	Test all positive and negative cases)			
View consultation in history for email "test2@gmail.com" 10:17 10/01/26	For this test, ensure that account test2@gmail.com is created. Log into test2@gmail.com or any other account that isn't test3@gmail.com.	Should not show anything under consultation history as the consultation was booked under a different email.	No consultation history is shown.	Works as intended
View consultation in history for email "test3@gmail.com" 10:17 10/01/26	Ensure that test3@gmail.com account is created. Log into that account.	Should show the user the consultation that they just booked with the email with status pending and an action to cancel it.	Shows the user the consultation and gives the action option	Works as intended
View and manage consultation history using admin account "admin@rolsa.com" password "admin" 10:23 16/01/26	Premade account, no need to create an account. Log into admin account	Should see an admin panel with all consultations. Find consultation for test3@gmail.com. Should say status pending.	The admin panel is shown with the most recent consultation being on the top. Status is shown as pending	Works as intended
Cancel the consultation using the action button whilst logged into the account "test3@gmail.com" 10:30 16/01/26	Press the "x" action button next to the consultation.	The status for the consultation should get changed to cancelled and it should update in phpmyadmin	Consultation is shown to be cancelled in phpmyadmin and history viewer. test3@gmail.com +44 7775 212752 consultation pe13rx none testing consultation 1 cancelled 2026-01-16 10:17:28	Works as intended

View the consultation on the admin account, filter by account "test3@gmail.com" to find all consultations for that account, then change status to completed. 10:40 16/01/26	Log into admin account, filter email by "test3@gmail.com" Best to create multiple accounts and consultations / installations for accurate viewing.	Should filter for all results that have email "test3@gmail.com". Changing the status to completed for the selected consultation should update it on phpmyadmin	The filter system can be used, however, it doesn't work efficiently. Once a value is entered, it's automatically removed and very difficult to actually filter. Changing status does update it to completed or whatever was selected in the backend. test3@gmail.com +44 7775 212752 consultation pe13rx none testing consultation 1 complete 2026-01-16 10:17:28	Semi works as intended. Filter needs to be patched to not automatically remove the value entered. Also, if no results are found, the filter bar is gone completely and the page needs to be refreshed. This should not happen. No consultations found.
View the consultation on the admin account, filter by account "test3@gmail.com" to find all consultations for that account, then change status to completed. 11:05 16/01/26	Log into admin account, filter email by "test3@gmail.com" Best to create multiple accounts and consultations / installations for accurate viewing.	Should filter for all results that have email "test3@gmail.com". Changing the status to completed for the selected consultation should update it on phpmyadmin	Works as intended	Fixed filter bar issue. Now it doesn't refresh every time you type and it's much easier to filter
Edit full name and phone number for any account (not admin) 11:10 16/01/26	Log into any existing account and edit your data under the "Your Data" section.	There should be the same kind of checks for phone number and name like in the signing up or form.	When trying to change names, it requires phone validation. This should only apply to phones and not names.	Fix so the validation only applies to the phone number not both

Edit full name and phone number for any account (not admin) 11:16 16/01/26	Log into any existing account and edit your data under the “Your Data” section.	There should be the same kind of checks for phone number and name like in the signing up or form.	Only uk valid phone numbers are accepted, any full name is accepted. From: To: 	Works as intended. Errors have been fixed
Test the carbon footprint / energy consumption calculator (1) 11:20 16/01/26	Locate the calculator on the first page, or via navigation bar, first test choosing either one of the options (carbon footprint or energy consumption)	The chosen option should be highlighted green and underlined making it a bit bolder. The content below should dynamically update depending on the options chosen	  Works as intended, options are	Works as intended

			swapped depending on what's chosen	
Test the carbon footprint / energy consumption calculator (2) 11:24 16/01/26	Test carbon footprint calculator by filling in the values for the different categories and ensure output is correct. Try negative and positive values as well as string / characters	Only numbers should be accepted that are larger than or equal to 0, displaying a corresponding result based on the factors put in	No strings can be inputted, only positive numbers are allowed. Decimals also work fine. Correct result is outputted	Works as intended
Test the carbon footprint / energy consumption calculator (3) 11:26 16/01/26	Test the energy consumption calculator, playing with all the different input fields. Test positive and negative values	No strings should be accepted or negative values	No strings are accepted or negative values, correct outputs are also displayed	Works as intended
Test accessibility options 11:28 16/01/26	Open the accessibility menu that is in the bottom left corner on all pages. See if the user can close it, and if all the options work.	The user should be able to press the button to open the menu, and then have a button to close the menu. Larger text should make all fonts larger, smaller text should make all fonts smaller. High contrast should turn the contrast of the website up, making sure it's all still readable, lower motion should stop all motion / animations. The	All features work as expected, however, the menu cannot be closed. Additionally, the high contrast makes it unreadable.	Work on the accessibility menu adding a close feature, and improve the color schemes of the high contrast such as making the background color flip.

		reset button should reset all to the original state.		
Test accessibility options 11:46 16/01/26	Try testing the accessibility options again	All the font size options should either make the font smaller, default or larger. The contrast should make the contrast really high or default, the motion should reduce all motion across the website. A close button to close the menu	The contrast button now changes the background color too, making it readable. A close button was implemented to allow the menu to be closed and a third font size button for default was added, meaning other accessibility options don't need to be reset	Works as intended, all errors have been fixed.
Test keyboard navigation for accessibility 11:47 16/01/26	Pressing the tab, shift tab and enter keys whilst on the website	All aspects of the website should be usable and navigable through just keyboard inputs. Tab should take the user to the next button, shift tab should take the user back by one, and enter should make the button press.	The user can successfully navigate all aspects of the website through the use of a keyboard. All accessibility options and account options and calculators work flawlessly with just a keyboard.	
Test scaling of the website on different aspect ratios and devices 11:49 16/01/26	By using inspect element, you can change the resolution size of the window and change to mobile or tablet format.	All content should be viewable from different aspect ratios and devices.	Resizing and scaling works as expected. Boxes and larger items stack on top of each other if they do not fit horizontally, text fits to the website.	One issue does occur when getting to an extremely small aspect ratio, however, this can be ignored as no devices are that small, and hence, is irrelevant. All

				content is still readable at that point, just a little bit messy.
Color blindness filter test - Accessibility 11:52 16/01/26	Apply different color filters via an google extension that will simulate how the website will look on different color blindness modes	All content should be readable and viewable	All content is still readable and viewable.	This is not the ideal test case as I am not color blind and cannot accurately test this.
Ensuring API works as intended 09:52 19/01/26	Select different locations from the predetermined list of locations	EV Chargers with corresponding information should be provided	All correct information is provided once a location is provided.	A maximum of 50 uses per hour can be used due to rate limits provided by the API provider. This is because each search uses 2 API calls (one for geomapping, and the other for returning an appropriate ev charger location based on the geo map) and there's a maximum of 100 calls per hour for members using the FREE plan

Additional test that was forgotten earlier: Admin account efficiency 10:06 19/01/26	Time how long it takes to return 10 entries from the database, and then time how long it takes to return 20 entries, then test ram increase from 10 -> 20 entries	As more entries are being returned, it should take longer and be more resource efficient to display all the entries.	Showing rows 0 - 14 (15 total, Query took 0.0003 seconds.) Showing rows 0 - 5 (6 total, Query took 0.0003 seconds.) Test data is too small to make an accurate assumption about what would occur. Hundreds of queries would need to be made for slightly more accurate testing, however, it's a safe assumption to make that once more entries are created, it will take longer to return all of them and display every single one on the filter.	This is expected behaviour, however, it can cause larger problems when there's potentially thousands of entries that need to be returned and loaded.

Add more rows and tables as required.
