User Feedback Strategy

Running the Website

Feedback will be gathered within a controlled environment where the user (person giving feedback) and host (person gathering feedback) can interact.

To set up the feedback gathering, the user will need to be connected to the same network as the host. The host runs the website using XAMPP and will then provide a link by getting their IP address (going to command prompt and doing IP Config, copying the IPv4 and using that as the link) and using the laptop as a host for the website.

Audience

Both Technical and Non Technical users will be asked to partake in this survey to gather accurate opinions based from what other developers and everyday users may think.

Im gathering information from both Technical and Non Technical users so that i can get a range of opinions such as the efficiency of the website in terms of the backend and what the typical day to day users will think of the front end.

This feedback survey will be based on all users, those who have and have not used the website previously as to gather a general, broad understanding of what users feel allowing for a wide range of opinions not from a specific group of people. This is also the case as the entire website needs to be used to gather feedback and not a specific segment.

Gathering Feedback

After confirming that the user can successfully connect to the website, the user will have free range to explore the website and gather their thoughts.

The questions are to gather important information such as:

- Design: Is the website's design pleasing, can aspects of the website be improved etc.
- Accessibility: Is the website considered accessible, having multiple features to aid potential impairments?
- Functionality: Does the website perform its function as intended?

- Easy to understand: Does the user understand the intent behind the website? Is the website easy to navigate and understand? Can use CES (Customer Effort Score) to measure how hard it was for users to do what they needed.
- What the user likes and dislikes about the website

This information is extremely useful and important as it can be used to update and improve the current versions of the website. It will also tell the developers what is going well and what needs to be improved upon.

Data will be gathered through the use of a Google Form as it provides a range of tools to allow both quantitative and qualitative data to be gathered efficiently, as well as easy-to-create forms that any user can access. It is also the most easy to implement compared to other forms of gathering data such as Email or in-website surveys as those would require additional set up or programming to implement whereas with a Google Form, a simple link can be provided whilst also being free to use.

Next Step

The host should gather roughly 20 - 30 different forms to have a wide range of responses. These forms should use validation and verify the integrity of the data inside to prevent spam and troll responses. The host can look through the forms to determine and remove any troll responses.

Once the forms have been completed and validated, Google Forms offers many graphing options that can be used on the qualitative data to display the information in an easy to understand way. This will allow for the developers to access the data and see what is going well and what isn't.

Non Technical Users

Home Page

Once the user enters the page, they are to test the first Home Page.

- Have the user go through the entire page, and gather their opinions on the design.
- Gather any potential improvements

- Gather thoughts of ease of use

Once review of the Home page is complete, have the user use the navigation bar at the top of the page or the boxes in the middle of the page to redirect to other pages.

References.

Educational Visits Page

Once the user enters the Educational Visits page, have them play around with what they want to experience the website with no interruptions.

One place of interest would be the materials download page.

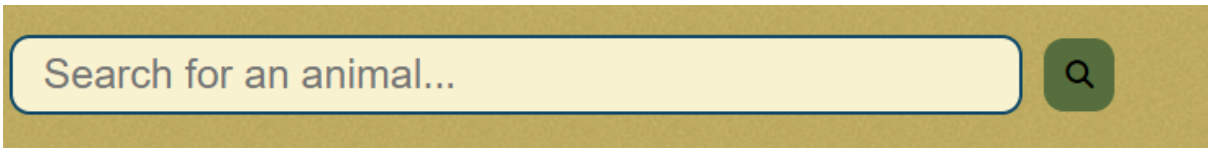
Gather the users:

- Opinion on the design
- Opinion on ease of use for material download
- Is it easy to understand the page?
- Could content be formatted differently?

Information Page

Once the user enters the Information Page, allow them to freely play around with any accessible content within the page.

One place of interest would be the Animal Search bar.



Gather information regarding:

- Information provided regarding the zoo
- Animal searching
- Design opinions
- Content formatting

Account Page

Once the user has entered the account page, give them free range to test and play around with any features provided by the account page.

Gather information regarding the:

- Sign up process
- Log in process
- Any bugs or errors encountered
- Opinions on design
- Overall opinion on the signup / log in process.
- Content provided after logging in / creating an account

Booking Page

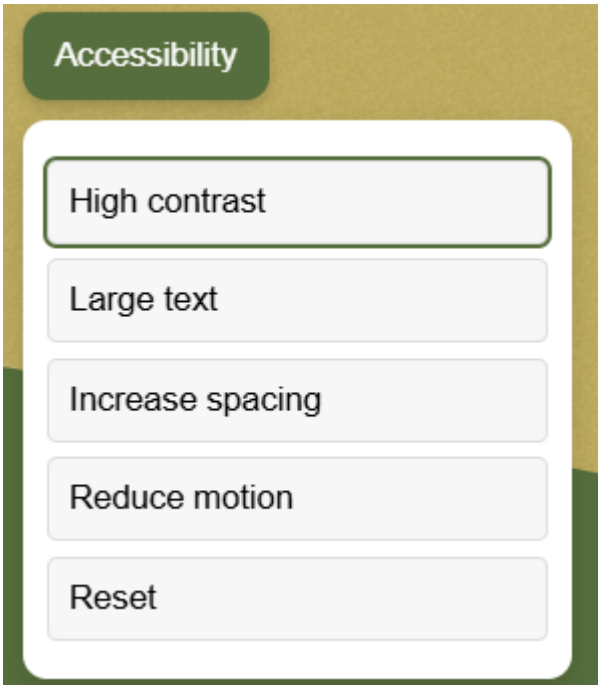
Once the user has entered the booking page, give them free range to test and play around with any features provided by the booking page. This should include following the entire booking process and successfully booking either an accommodation or ticket. No payment is required.

Gather information regarding:

- The entire booking process
- Any issues encountered
- Any pain points
- Design opinions
- Design improvements
- Ease of use
- Understanding

Accessibility Options

In the bottom right corner of every page, there is an accessibility button with numerous different options. Let the user test them and see if they are functional and useful.



Gather feedback on:

- Did the features work as intended?
- Did the user find them useful
- Is there any features they'd like to see

Technical User Feedback

For technical user feedback, refer to Non-Technical User feedback for the first section. In the second section, refer to code screenshots to provide the user with additional information regarding what the code does and what they need to give feedback on. This includes code snippets from the database, code base structure and maintainability of the code.

Additionally, give the technical users the ability to test on different devices by following the same process to connect to the website.
